

TAMS II

How to Pull a Class Return with an RF Scanner

Before you begin

- Print the **Return Worksheet** in **TAMS II / Web Classification** to keep track of the parts as you scan.
- Do not make any edits to the return in **TAMS / Web Classification** or all part quantities will be changed to 0 and you will not be able to print the **Return Worksheet**.
- Classification returns are usually coordinated by your Classification Team or Representative (Company Owned Stores) or Territorial Sales Manager (TSM) for independently owned stores.
- Contact your coordinator if you have questions about the classification process.

- 1 Log in to the RF scanner, scroll to **Class Pull**, and press **Enter**.

- 2 Select the number of the **Class Returns Session** from the **Return Worksheet**.

- 3 Select **All** for a new Class Return, **Variance only** for parts not found, or **Partial Pull** to resume an interrupted session.

- 4 Scan each part in the **Class Return** to update. If a part cannot be found, press the down arrow to move to the next part.

For manual entry, use the scanner input field highlighted above. Multiple users can work on the same return at the same time by entering a different line code.

- 5 When all parts in the **Class Return** have been scanned, press **ESC** to exit the scanner session.

- 6 Your coordinator will finalize the session. The return cannot be modified once finalized.
